New mammalian soluble interferon alpha-receptor forms - used for inhibiting, modulating or modifying the activities of interferon(s) Example 2; Fig 7; 46pp; English.

C (W21805) is characterised by a new domain (S) which follows an end-deleted extracellular domain when compared to transmembranal IFNAR (W21804). There is no transmembrane domain. The amino acid sequence is predicted from a cDNA clone (see also T73520) obtd.

C from human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 and 2 (see also W21806) probably regulate the response of human cells to IFNS, either by acting as IFN antagonists or by regulating the activity of the multiple IFN subtypes. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNS alpha and beta in cells, tissues and organisms, or for diagnostic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     documentation_block:

The transmembrane and cytoplasmic domains of the native IFN receptor have been deleted to obtain a soluble, circulating form of the receptor. Potentially immunogenic epitopes have thus been eliminated. Derivatives obtained by substitution or deletion of this sequence are also claimed as are hybrid molecules comprising the soluble receptor (or deriv.) and an immunoglobulin such as IgG1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   documentation_block:

A recombinant soluble form of the human interferon class I protein extracellular domain, given in R71723, was expresse either E. coli or COS cell hosts. The protein was used to immunomodulatory monoclonal antibodies.
New mammalian soluble interferon alpha-receptor forms - used for inhibiting, modulating or modifying the activities of interferon Example 3; Fig 7; 46pp; English.

              New human alpha-interferon receptor protein - useful for testir interferon agonists and in treatment or diagnosis Disclosure; fig 4, 30pp; French.
This recombinant human alpha interferon (IFN) receptor protein useful for the testing of IFN agonists and for treatment and discending the testing of IFN agonists and for treatment and discending the testing of IFN agonists and for treatment and discending the testing of IFN agonists and for treatment and discending the testing of IFN agonists and for treatment and discending the testing of IFN agonists and for the testing of IFN agonists and for treatment and discending the testing of IFN agonists and for the testing of IFN agonists and for the testing of IFN agonists and for the testing of IFN agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (W21806) is characterised by a double deletion when compared to transmembranal IFWAR (W21804). The extracellular domain is shortened by 6 amino acid residues and is followed by a truncated intracellular domain. There is no transmembrane region. The amino acid sequence is predicted from a cDNA clone (see also T73521) obtd. from human myeloma U266 cells. Soluble, non-membrane bound IFWAR splice-deleted forms 1 (see also W21805) and 2 may regulate the response of human cells to IFNs, either by acting as IFN antagonists or by regulating IFN activities. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNs alpha and beta in cells, tissues and organisms, or for diagnostic representations.
                                                                                                                                                                                                                                                       W09105862-A.

R14488 standard; Pr
               New water-soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus, Behcet's disease, aplastic anaemia, diabetes mellitus, rheumatoid arthritis, etc. plastlosure; Page 47; S2pp; French.

The invention covers derivatives of the interferon alpha and/or beta receptor obtained by deleting the transmembrane and cytoplasmic domains of the native receptor or by substitution. Potentially immunogenic epitopes are eliminated and the deriv. can be secreted from transformed cells. Soluble deriv.s block the activity of IFN alpha/beta and can be used to treat autoimmune diseases or to inhibit graft rejection. See also 014239.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               this protein can be used for blocking the receptor when required, eg where overexpression of alpha-IFN is harmful. The Abs are also useful for eg drug targetting. Variants of the protein, having residue 164 (Thr) replaced by Arg and an Asp inserted between residues 479 and 480, are also useful.

                                                             water soluble polypeptide(s) strongly bind interferon(s) alpha and beta - useful as immunosuppressants, for treating auto:immune diseases and transplant rejection claim 3; Fig 2; 58pp; English.

DNA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate oligonucleotides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (030533), was incubated with oligos 030534 and 030535. R28496 represents the complete receptor. R28495 lacks the transmembrane and cytoplasmic domains. Both forms bind the transmembrane and cytoplasmic domains.
                                                                                                                                                                                                                                                                                                           17-APR-1991; WO-F00318.

Disclosure; Fig 3; 21pp; English.

Monoclonal antibodies produced against soluble forms of the human interferon alpha-beta receptor based on the full-length human IFN-R sequence are claimed. The antibodies are useful for treatment and prophylaxis of disorders involving cell proliferation and/or viral

Compsn. of monoclonal antibodies against interferon receptor reseful as immuno:modulator, eg. for treating AIDS pisclosure; F1g.3A-2B; 105pp; English.

The amino acid sequence of human interferon class I receptor is constant of this receptor (R7123) has been used to raise communomodulatory monoclonal antibodies.

Human transmembranal interferon alpha receptor (IFNAR) (W21804) includes a 21-amino acid transmembrane region. Novel, splice-deleted IFNAR forms 1 (W21805) and 2 (W21806) have been detected that lack this transmembrane domain. These, soluble non-membrane bound polypeptides can be expressed in host cells and used to

Claim 1b; Page 58-62; 69pp; English.
This invention describes a novel human breast cancer gene encoding a nuclear receptor-binding auxiliary protein, brx. The brx encoded protein nuclear receptor-binding auxiliary protein, brx. The brx encoded protein has anti-cancer, anti-proliferative and mitogenic activity and acts as a transcription factor and tumour suppressor. Levels of expression of Brx can be detected using the primers, probes and antibodies (contained in the kit) to determine a predisposition to breast and ovarian cancer and other proliferative disorders of immune tissues. Vectors containing the Brx gene can be used for prevention and treatment of cancers and proliferative diseases of mammalian reproductive and immune tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Driggers PH, Rubino DM, WPI; 99-254688/21. This invention describes a novel human breast cancer gene encoding a nuclear receptor-binding auxiliary protein, brx. The brx encoded protein nuclear receptor-binding auxiliary protein activity and acts as a transcription factor and tumour suppressor. Levels of expression of Brx transcription factor and tumour suppressor. Levels of expression of Brx transcription factor and tumour suppressor and antibodies (contained in the primers, probes and antibodies (contained in the primers) probes and antibodies containing the
                                                                                                                                                                                                                                                                                                                                                                                                  .documentation_block:

Vectors containing Brx gene can be used for prevention and treatment of cancers and proliferative diseases of mammalian reproductive and immune tissues. Sequence 30 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        seq_documentation_block:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cc encoding the interleukin-10 (IL-10) receptor (III0R) and a sequence (S2) cencoding the interleukin-10 (IL-10) receptor (III0R) and a sequences. CC cells containing (I) may be used to identify agonists/antagonist of CIL-10. Agonists are potentially useful, e.g. for preventing allograft crejection, as vaccine adjuvants, for treatment of photosensitivity, and inflammation, autoimmune disease and septic shock, while antagonists are contentially useful for increasing immune responses against tumours, viruses, bacteria and parasites (especially intracellular pathogens) and control or preventing organ rejection. A vector containing (I) is used to crestore, e.g. by gene therapy, II-10 sensitivity to a cell that expresses a dysunctional III0R and is able to bind II-10 but not to transduce a control of the contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ratio:

Murine ETS2 repressor factor (ERF) (M07702) is a member of the ETS (family and acts as a transcriptional repressor in mammalian cells. (Its amino acid sequence was deduced from the murine ERF gene (C (T47198). Human ERF (see also W07700) has also been identified. (C ERF has tumour suppressor activity. Chimeric molecules comprising the ERF repressor domain in combination with a heterologous tumourigenicity associated with inappropriate expression of transcription factors.
